## 2 INTRODUCTION

### 2.1 Requirements

We recommend reading the following guides:

- [First steps with Sofia2](#) (Pdf)
- [Script Rules creation](#) (Pdf)

### 2.2 Current document's goals and scope

This guide describes the APIS that can be used from the Scripting Rules engine of the Sofia2 Platform.

This guide includes:

- List of the available APIS
- List of the methods of each API
- Tasks of each method
- Input parameters of each method
- Results returned by each method
- Example of use of each method

### 2.3 APIS Scripting

The APIS that are available are:

API	Description
<b>APIHttpConnection</b>	API that offers various methods for establishing HTTP connections from a script
<b>APIJMS</b>	API to publish on JMS queues and topics from a script
<b>APILog</b>	API to log information from a script
<b>APIMail</b>	API to send mails from a script
<b>APIRTDB</b>	API to do operations on the real time DB from a script
<b>APIScripts</b>	API to invoke external scripts in R, Python,...
<b>APISofia</b>	<b>(DEPRECATED)</b> API unifying all operations.

<b>APISSAP</b>	API for SSAP communications from a script
<b>APITwitter</b>	API to publish tweets from a script
<b>APIUtils</b>	API of utilities

## 3 APIHttpConnection

### 3.1 httpGET(url)

<pre> /**  * Invoke an URL by GET HTTP method  * @param url String  * @return content of the URL String  */ def httpGET(url) throws ScriptException; </pre>	
<b>Description</b>	HTTP petition GET to a url
<b>Parameters</b>	String url: URL which is invoked through GET
<b>Results</b>	String contenido: content of the URL
<b>Use example</b>	<pre> def apihttpconnection = new APIHttpConnection(); def url = "https://www.google.es/search?q=sofia2"; def contenido = apihttpconnection.httpGET(url); println("Contenido httpGET" + contenido); </pre>

### 3.2 httpGET(url, timeout)

<pre> /**  * Invoke an URL by GET HTTP method establishing an timeout in miliseconds  * @param url String  * @param timeout in ms int  * @return content of the URL String  */ def httpGET(url, timeout) throws ScriptException; </pre>	
<b>Description</b>	HTTP petition GET to a url with defined timeout
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String url: URL which is invoked through GET</li> <li>int timeout: timeout (ms)</li> </ul>
<b>Results</b>	String contenido: content of the URL
<b>Use example</b>	<pre> def apihttpconnection = new APIHttpConnection();  def url = "https://www.google.es/search?q=sofia2";  def contenido = apihttpconnection.httpGET(url, 30000); println("Contenido httpGET con timeout" + contenido); </pre>

### 3.3 httpGET(url, headers, parameters)

<pre> /**  * Invoke an URL by GET HTTP method passing parameters and headers  * @param url String  * @param String[] headers  * @param String[] parameters  * @return content of the URL String  */ def httpGET(url, headers, parameters) throws ScriptException; </pre>	
<b>Description</b>	HTTP petition GET to a url passing headers and parameters

<b>Parameters</b>	<ul style="list-style-type: none"> <li>• String <b>url</b>: URL which is invoked through GET</li> <li>• String[] <b>headers</b>: headers of the petition</li> <li>• String[] <b>parameters</b>: parameters of the invocation</li> </ul>
<b>Results</b>	String contenido: content of the URL
<b>Use example</b>	<pre>def apihttpconnection = new APIHttpConnection();  String [] headers = ["X-SOFIA2- APIKey:9806ed2dfe3f4bdab78c5795c3a38878"];  String [] param=null;  String urlSemaforoAlarmaById="http://sofia2.com/sib- api/api/v2/semaforoalarmas/55818c33e4b032246d12d489";  String resGET = apihttpconnection.httpGET(urlSemaforoAlarmaById,headers,param);</pre>

### 3.4 httpPOST(url, parameters)

<pre>/**  * Invoke an URL by POST HTTP method passing parameters  * @param url String  * @param parameters Map&lt;String, String&gt;  * @return content of the URL String  */ def httpPOST(url, parameters) throws ScriptException;</pre>	
<b>Description</b>	HTTP petition POST to a url passing headers and parameters
<b>Parameters</b>	<ul style="list-style-type: none"> <li>• String <b>url</b>: URL which is invoked through GET</li> <li>• String[] <b>parameters</b>: parameters of the invocation</li> </ul>
<b>Results</b>	String contenido: contenido de la URL
<b>Use example</b>	<pre>def apihttpconnection = new APIHttpConnection();  String [] headers = ["X-SOFIA2- APIKey:9806ed2dfe3f4bdab78c5795c3a38878"];  String [] param=null;  String urlSemaforoAlarma="http://sofia2.com/sib- api/api/v2/semaforoalarmas";  String resPOST = apihttpconnection.httpPOST(urlSemaforoAlarma,param);</pre>

### 3.5 httpPOST(url, parameters, timeout)

<pre>/**  * Invoke an URL by POST HTTP method passing parameters with a timeout  * @param url String  * @param parameters Map&lt;String, String&gt;  * @param timeout in ms int  * @return content of the URL String  */</pre>	
--	--

<pre>*/ def httpPOST(url, parameters, timeout) throws ScriptException;</pre>	
<b>Description</b>	HTTP petition POST to a url passing headers and parameters with timeout
<b>Parameters</b>	<ul style="list-style-type: none"> <li>• String <b>url</b>: URL which is invoked through GET</li> <li>• String[] <b>parameters</b>: parameters of the invocation</li> <li>• int <b>timeout</b>: timeout (ms)</li> </ul>
<b>Results</b>	String contenido: content of the URL
<b>Use example</b>	<pre>def apihttpconnection = new APIHttpConnection();  String [] headers = ["X-SOFIA2- APIKey:9806ed2dfe3f4bdab78c5795c3a38878"];  String [] param=null; String urlSemaforoAlarma="http://sofia2.com/sib- api/api/v2/semaforoalarmas";  String resPOST2 = apihttpconnection.httpPOST(urlSemaforoAlarma,param,30000);</pre>

### 3.6 httpPOST(url, parameters, headers, body )

<pre>/**  * Invoke an URL by POST HTTP method passing parameters with headers and body  * @param url String  * @param parameters String []  * @param headers String []  * @param body String  * @return content of the URL String  */ def httpPOST(url, parameters, headers, body ) throws ScriptException;</pre>	
<b>Description</b>	HTTP petition POST to a url passing parameters with headers and body
<b>Parameters</b>	<ul style="list-style-type: none"> <li>• String <b>url</b>: URL which is invoked through GET</li> <li>• String[] <b>parameters</b>: parameters of the invocation</li> <li>• String[] <b>headers</b>: headers of the petition</li> <li>• String <b>body</b>: body of the petition</li> </ul>
<b>Results</b>	String contenido: content of the URL
<b>Use example</b>	<pre>def apihttpconnection = new APIHttpConnection();  String [] headers = ["X-SOFIA2- APIKey:9806ed2dfe3f4bdab78c5795c3a38878"];  String [] param=null;</pre>

	<pre>String urlSemaforoAlarma="http://sofia2.com/sib- api/api/v2/semaforoalarmas"; def mydate = new Date();  String instanciaAlarma="{ 'Alarm':{ 'timestamp':{ '&lt;dollar&gt;date': '+mydate.format("MM-dd- yyyy'T'HH:mm:ss.SSS'Z'")+'' }, 'assetId':1, 'severity':'LOW', 'type':'restPl an'}}";  String resPOST3 = apihttpconnection.httpPOST(urlSemaforoAlarma,param,headers,instanciaAlar ma);</pre>
--	--

### 3.7 httpPUT(url, parameters, headers, body )

<pre>/**  * Invoke an URL by PUT HTTP method passing parameters with headers and body  * @param url String  * @param parameters String []  * @param headers String []  * @param body String  * @return content of the URL String  */ def httpPUT(url, parameters, headers, body ) throws ScriptException;</pre>	
<b>Description</b>	HTTP petition PUT to a url passing parameters with headers and body
<b>Parameters</b>	<ul style="list-style-type: none"> <li>• String <b>url</b>: URL which is invoked through GET</li> <li>• String[] <b>parameters</b>: parameters of the invocation</li> <li>• String[] <b>headers</b>: headers of the petition</li> <li>• String <b>body</b>: body of the petition</li> </ul>
<b>Results</b>	String contenido: content of the URL
<b>Use example</b>	<pre>def apihttpconnection = new APIHttpConnection();  String [] headers = ["X-SOFIA2- APIKey:9806ed2dfe3f4bdab78c5795c3a38878"];  String []param=null;  String urlAlarma = "http://sofia2.com/sib- api/api/v1/alarmas/";  String putById= "{ 'Alarma':{ 'mensajeAlarma':'Temperatura Demasiado Alta', 'procedenciaAlarma': 'Casa', 'causa': 'Más de 100 grados', 'timestamp': 0}}";  String resPUT = apihttpconnection.httpPUT(urlAlarma,param,headers,putById);</pre>

## 4 APIJMS

### 4.1 sendJson2Queue(ontology, queue)

```
/**
 * Sends instance of the ontology to the JMS queue
 * @param instance of an ontology String
 * @param queue String
 * @return void
 */
def sendJson2Queue(ontology, queue) throws ScriptException;
```

<b>Description</b>	Sends an Ontology Instance to a JMS queue
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>ontology</b>: ontology instance on which on which we will query</li> <li>String <b>queue</b>: JMS queue</li> </ul>
<b>Results</b>	void
<b>Use example</b>	Where the ontology is delayJustification  <pre>def apijms = new APIJMS(); apijms.sendJson2Queue(ontology, "cola.sensor.ambiental");</pre>

### 4.2 sendJson2Topic(ontology, topic)

```
/**
 * Sends instance of the ontology to the JMS topic
 * @param instance of an ontology String
 * @param topic String
 * @return void
 */
def sendJson2Topic(ontology, topic) throws ScriptException;
```

<b>Description</b>	Sends an ontology instance to JMS topic
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>ontology</b>: ontology instance on which we will query</li> <li>String <b>topic</b>: topic JMS</li> </ul>
<b>Results</b>	void
<b>Use example</b>	On the ontology delayJustification:  <pre>def apijms = new APIJMS(); apijms.sendJson2Topic(ontology, "topicPrueba");</pre>

### 4.3 sendXml2Queue(ontologyName, ontology, queue)

<pre> /**  * Sends instance of the ontology as XML to the JMS queue  * @param ontologyName String  * @param instance of an ontology String  * @param queue String  * @return void  */ def sendXml2Queue(ontologyName, ontology, queue) throws ScriptException; </pre>	
<b>Description</b>	Sends an ontology instance as XML to a JMS queue
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>ontologyName</b>: name of the ontology on which we will query</li> <li>String <b>ontology</b>: ontology instance on which we will query</li> <li>String <b>queue</b>: JMS queue</li> </ul>
<b>Results</b>	void
<b>Use example</b>	<p>On the ontology delayJustification:</p> <pre> def apijms = new APIJMS();  apijms.sendXml2Queue(ontologyName, ontology, "ADIF.ESB.DELAYJUSTIFICATION"); </pre>

### 4.4 sendXml2Topic(ontologyName, ontology, topic)

<pre> /**  * Sends instance of the ontology as XML to the JMS topic  * @param ontologyName String  * @param instance of an ontology String  * @param queue String  * @return void  */ def sendXml2Topic(ontologyName, ontology, topic) throws ScriptException; </pre>	
<b>Description</b>	Sends an ontology instance as XML to the topic JMS
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>ontologyName</b>: name of the ontology on which we will query</li> <li>String <b>ontology</b>: ontology instance on which we will query</li> <li>String <b>topic</b>: topic JMS</li> </ul>
<b>Results</b>	void
<b>Use example</b>	<p>On the ontology delayJustification:</p> <pre> def apijms = new APIJMS();  apijms.sendXml2Topic(ontologyName, ontology, "topicPrueba"); </pre>

## 5 APILog

### 5.1 logDebug(message)

```
/**
 * Logs a debug message on the log4j Appender defined
 * @param message String
 * @return void
 */
def logDebug(message) throws ScriptException;
```

<b>Description</b>	Method to log a DEBUG type message in the defined Appender.
<b>Parameters</b>	String <b>message</b> : message to publish
<b>Results</b>	void
<b>Use example</b>	def apilog = new APILog(); apilog.logDebug("We are debugging the block THEN");

### 5.2 logInfo(message)

```
/**
 * Logs a info message on the log4j Appender defined
 * @param message String
 * @return void
 */
def logInfo(message) throws ScriptException;
```

<b>Description</b>	Method to log an INFO type message in the defined Appender.
<b>Parameters</b>	String <b>message</b> : message to publish
<b>Results</b>	void
<b>Use example</b>	def apilog = new APILog(); apilog.logInfo("The condition if is met");

### 5.3 logWarn(message)

```
/**
 * Logs a warn message on the log4j Appender defined
 * @param message String
 * @return void
 */
def logWarn(message) throws ScriptException;
```

<b>Description</b>	Method to log a WARN type message in the defined Appender.
<b>Parameters</b>	String <b>message</b> : message to publish
<b>Results</b>	void
<b>Use example</b>	def apilog = new APILog(); apilog.logWarn("Attention this can provoke an Error of division by 0");

## 5.4 logError(message)

```
/**
 * Logs a error message on the log4j Appender defined
 * @param message String
 * @return void
 */
def logError(message) throws ScriptException;
```

<b>Description</b>	Method to log an ERROR type message in the defined Appender.
<b>Parameters</b>	String <b>message</b> : message to publish
<b>Results</b>	void
<b>Use example</b>	<pre>def apilog = new APILog(); apilog.logError("An error has occurred in the execution of the script APILog");</pre>

## 6 APIMail

### 6.1 sendMail(to, subject, msg)

```

/**
 * send an email to multiple recipients
 * @param to String[]
 * @param subject String
 * @param msg String
 * @return void
 */
def sendMail(to, subject, msg) throws ScriptException;
    
```

<b>Description</b>	Method to send emails to different recipients
<b>Parameters</b>	<ul style="list-style-type: none"> <li>• String[] <b>to</b>: recipients</li> <li>• String <b>subject</b>: subject</li> <li>• String <b>msg</b>: body of the message</li> </ul>
<b>Results</b>	void
<b>Use example</b>	<pre> def apimail = new APIMail();  api.sendMail(["mymail@mail.com", "mymail2@mail.com"], "Subject of the mail", "Message of the mail")                     </pre>

## 7 APIRTDB

### 7.1 query(ontologyName, query)

```
/**
 * Makes a query on the Real Time DB for the ontology
 * @param name of ontology String
 * @param native query String
 * @return JSON result String
 */
def query(ontologyName, query) throws ScriptException;
```

<b>Description</b>	Method to make queries on the RTDB
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>ontologyName</b>: name of the ontology on which we will query</li> <li>String <b>query</b>: native query</li> </ul>
<b>Results</b>	String result: result of the query
<b>Use example</b>	<a href="http://about.sofia2.com/2015/06/09/comando-de-scripting-getinbdtr/">http://about.sofia2.com/2015/06/09/comando-de-scripting-getinbdtr/</a>  <pre>def apirtdb = new APIRTDB(); String valor = apirtdb.query("MeteoMiguel10", "{'MeteoMiguel10.Temperature':{&lt;math&gt;\\$&lt;/math&gt;}}");</pre>

### 7.2 insert(ontologyName, data)

```
/**
 * Inserts the data passed as a instance of the ontology
 * @param ontologyName String
 * @param data of the instance String
 * @return result String
 */
def insert(ontologyName, data) throws ScriptException;
```

<b>Description</b>	Method to perform an insert of data of an ontology of the Real Time Database
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>ontologyName</b>: name of the ontology we will query</li> <li>String <b>data</b>: instance on the ontology to insert</li> </ul>
<b>Results</b>	String result: result of the insert
<b>Use example</b>	<pre>def apirtdb = new APIRTDB();  String insDate= "{'&lt;math&gt;\\$&lt;/math&gt;date': '"+mydate.format("yyyy-MM-dd'T'HH:mm:ss.SSS'Z'")+''}";  String myIsntance="{'MoteSensor':{'mote_id':{'id':1,'serial_number':'string'},'humidity':1,'temperature':1,'battery':1,'timestamp':{'&lt;math&gt;\\$&lt;/math&gt;date': '"+mydate.format("yyyy-MM-dd'T'HH:mm:ss.SSS'Z'")+''}}";  def resultInsert=apirtdb.insert("MoteSensor", myIsntance);</pre>

### 7.3 insertInBDTR (executionContext, ontologyName, data)

```
/**
 * Insert de datos de una ontología de la Base de Datos de Tiempo Real
 *
 * @param ontologyName String
```

<pre>         * @param data String         */         def insertInBDTR(executionContext, ontologyName, data) throws         ScriptException     </pre>	
<b>Description</b>	Data Insert in an ontology of the Real Time Database
<b>Parameters</b>	<ul style="list-style-type: none"> <li>• ExecutionContext <b>executionContext</b>: Object composed of sessionKey and ontology name</li> <li>• String <b>ontologyName</b>: name of the ontology on which we will query</li> <li>• String <b>data</b>: ontology instance to insert</li> </ul>
<b>Results</b>	String result: result of the insert
<b>Use example</b>	<pre> def apirtdb = new APIRTDB();  String                                insertData="{ 'Chat':{ 'autor':'string','mensaje':'string'}}";  /* Para obtener el sessionKey lanzar: {"join": true,"instanceKP": "KP_chat:KP_chat01","token": "e42636d6fb54473db754e2f8d5ea9729"} */  def apiExecution= new ExecutionContext ("c8d20685-ade2-46cb- 915e-4c7037724f79","Chat");  def resultInsert2=apirtdb.insertInBDTR(apiExecution, "Chat", insertData);     </pre>

## 7.4 update(ontologyName, query, data)

<pre> /**  * Update the data of the Real Time DB with the query passed  * @param query String  * @param data String  * @return result String  */ def insert(ontologyName, data) throws ScriptException;     </pre>	
<b>Description</b>	Method to perform update of data of an ontology of the Real Time Database
<b>Parameters</b>	<ul style="list-style-type: none"> <li>• String ontologyName: name of the ontology we want to update</li> <li>• String query: query</li> <li>• String data: data to modify</li> </ul>
<b>Results</b>	String result: result of the update
<b>Use example</b>	<pre> def apirtdb = new APIRTDB();  String                                query                                = "{'MoteSensor.mote_id.serial_number':'PRUEBAAPITEST'}";  String data ="{'&lt;dollar&gt;set':{'MoteSensor' : { 'mote_id' : { 'serial_number' : 'PRUEBAUPDATEAPITEST' }}}}"  def resultUpdate = apirtdb.update("MoteSensor",query,data);     </pre>

## 7.5 delete(ontologyName, id)

```

/**
 * Delete the record of the id and ontology passed as parameters from the
RTDB
 * @param ontologyName String
 * @param id instance String
 * @return result String
 */
def delete(ontologyName, id) throws ScriptException;

```

<b>Description</b>	Deletes the ontology record of an ID
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String ontologyName: ontology</li> <li>String id: identifier OID</li> </ul>
<b>Results</b>	String result: result of the delete
<b>Use example</b>	<pre> def apirtdb = new APIRTDB();  def resultDelete= apirtdb.delete("MoteSensor",resultInsert); </pre>

## 7.6 findInCircle(ontologyName, indexName, longitude, latitude, radio)

```

/**
 * Makes a geospatial query finding elements of the ontology on the center
with this ratio
 * Example:
 /
 * @param ontologyName String
 * @param indexName String
 * @param longitude double
 * @param latitude double
 * @param radio in metres int
 * @return
 */
def findInCircle(ontologyName, indexName, longitude, latitude, radio)
throws ScriptException;

```

<b>Description</b>	Geoespatial query to find inside a circle
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>ontologyName</b>: name of the ontology on which we will query</li> <li>String <b>indexName</b>: name of the index on which we will query</li> <li>Double <b>longitude</b>: longitude coordinate</li> <li>Double <b>latitude</b>: latitude coordinate</li> <li>Int <b>radio</b>: radius expressed in meters</li> </ul>
<b>Results</b>	String result: result of the query
<b>Use example</b>	<pre> def apirtdb = new APIRTDB(); def attrib1= apirtdb.findInCircle("pt_bus","MobileElement.geometry", 8.39, 43.37,100); def var1=(attrib1.size() &gt; 0);  if(var1){     return true; }else{     return false; } </pre>

	<a href="http://about.sofia2.com/2015/07/08/como-hacer-busquedas-de-elementos-en-una-zona-concreta/">http://about.sofia2.com/2015/07/08/como-hacer-busquedas-de-elementos-en-una-zona-concreta/</a>
--	---

Wrapper of the query nearsphere of MongoDB:  
<http://docs.mongodb.org/manual/reference/operator/query/nearSphere/>

## 8 APIScripts

### 8.1 executeRScript(scriptName, param)

```
/**
 * Ejecuta un Script R admite parámetros de entrada
 *
 * @param scriptName String
 * @param param String
 */
def executeRScript(scriptName, param);
```

<b>Description</b>	Execution of a parameterizable R script
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>scriptName</b>: name of the script to execute, located by a system administrator in the server's script route</li> <li>String <b>param</b>: execution parameters</li> </ul>
<b>Results</b>	String retorno
<b>Use example</b>	<pre>def apiscripts = new APIScripts();  def executeRScript(scriptName, param) = apiscripts.executeRScript("scriptParamPrueba.R", "valid"); if (retorno2.contains("valid")){     return true; } else {     return false; }</pre>

### 8.2 executeRScript(scriptName)

```
/**
 * Ejecuta un Script R sin parámetros de entrada
 *
 * @param scriptName String
 */
def executeRScript(scriptName) throws ScriptException;
```

<b>Description</b>	Execution of a R script without parameters
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>scriptName</b>: name of the R script to execute, located by a system administrator in the server's script route</li> </ul>
<b>Results</b>	String return
<b>Use example</b>	<pre>def apiscripts = new APIScripts(); def retorno = apiscripts.executeRScript("scriptPrueba.R");  if (retorno.contains("valid")){     return true; } else {     return false; }</pre>

### 8.3 executeMongoScript(scriptName, param)

```
/**
```

<pre>* Ejecuta un Script Mongo * * @param scriptName String */ def executeMongoScript(scriptName, param) throws ScriptException;</pre>	
<b>Description</b>	Execution of a Mongo script with parameters
<b>Parameters</b>	<ul style="list-style-type: none"><li>• String <b>scriptName</b>: name of the Mongo script to execute, located by a system administrator in the server's script route</li><li>• String <b>param</b>: Execution parameters</li></ul>
<b>Results</b>	String return
<b>Use example</b>	<pre>def apiscripts = new APIScripts(); apiscripts.executeMongoScript("scriptPrueba.js");</pre>

## 9 APISSAP

### 9.1 sendInsertMessage(token, kpInstance, ontologyName, data)

```
/**
 * Inserts the data passed as a instance of the ontology passing token an kp
 * @param token String
 * @param instance of KP String
 * @param ontologyName String
 * @param data of the instance String
 * @return result SSAPMessage
 */
def sendInsertMessage(token,kpInstance,ontologyName,data) throws ScriptException;
```

<b>Description</b>	Méthod to send an email to different recipients
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>token</b>: connection token</li> <li>String <b>kpInstance</b>: KP instance</li> <li>String <b>ontologyName</b>: name of the ontology</li> <li>String <b>data</b>: JSON with the SSAP message</li> </ul>
<b>Results</b>	SSAPMessage result
<b>Use example</b>	<pre>def apissap = new APISSAP();  def mydate = new Date();  String insDate= "{"&lt;dollar&gt;date": '"+mydate.format("yyyy-MM-dd'T'HH:mm:ss.SSS'Z')+""}";  String myIsntance="{ 'MoteSensor':{ 'mote_id':{ 'id':1, 'serial_number': 'E STRELLA'}, 'humidity':1, 'temperature':1, 'battery':1, 'timestamp': {'&lt;dollar&gt;date': '+mydate.format("yyyy-MM-dd'T'HH:mm:ss.SSS'Z')+""}}}"; String token = "cbc6135f48104195bf10aae6be20c5c9"; String kpInstance = "Kp_Mote:Kp_Mote01"; String nameOntology = "MoteSensor";  def resultsendInsertMessage=apissap.sendInsertMessage(token,kpInsta nce,"MoteSensor", myIsntance);</pre>

## 10 APITwitter

### 10.1 sendTweet(apiKey, apiKeySecret, token, tokenSecret, parameters)

```
/**
 * Envía un tweet a la cuenta definida por los parámetros apiKey y token
 * @param apiKey String
 * @param apiKeySecret String
 * @param token String
 * @param tokenSecret String
 * @param parameters Map<String, String>
 * @return void
 */
def sendTweet(apiKey, apiKeySecret, token, tokenSecret, parameters);
```

<b>Description</b>	Method to publish a tweet in the account received in the parameters.
<b>Parameters</b>	<ul style="list-style-type: none"> <li>• Twitter account keys <ul style="list-style-type: none"> <li>○ String <b>apiKey</b></li> <li>○ String <b>apiKeySecret</b></li> <li>○ String <b>token</b></li> <li>○ String <b>tokenSecret</b></li> </ul> </li> <li>• Map <b>parameters</b>: Invocation parameters of twitter API. Ej: "status": "text of the tweet".</li> </ul>
<b>Results</b>	String id inserted
<b>Use example</b>	<pre>def apiKey = "XXXXXXXXXXXXXXXXXXXXXXXXXXXX"; def apiKeySecret = "XXXXXXXXXXXXXXXXXXXXXXXXXXXX"; def token = "XX"; def tokenSecret = "XX";  def personDetails = [text:"have we reached Rome?",     password:"XXX",// contraseña de proxy     port:"8080",     user:"XXXXX",     host: "proxy.indra.es"];  def apitwitter = new APITwitter(); String resultado = apitwitter.sendTweet(apiKey, apiKeySecret, token, tokenSecret, personDetails);</pre>

## 11 APIUtils

### 11.1 getValue(ontologyName, attribute)

```
/**
 * get the value of an attribute from an ontology
 * @param ontologyName String
 * @param attribute String
 * @return value of the attribute String
 */
def getValue(ontologyName, attribute) throws ScriptException;
```

<b>Description</b>	Method to extract a simple value from an ontology instance.
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>ontologyName</b>: name of the ontology on which we will query</li> <li>String <b>attribute</b>: attribute of which we will recover the value.</li> </ul>
<b>Results</b>	String: attribute value
<b>Use example</b>	On the ontology TestSensorTemperatura:  <pre>def apiutils = new APIUtils(); String attribute = "Sensor.assetId"; def resultado = apiutils.getValue(ontology, attribute);</pre>

### 11.2 getValueJson(instancia, attribute)

```
/**
 * get the value of an attribute from an ontology in JSON
 * @param ontologyName String
 * @param attribute String
 * @return value of the attribute in JSON String
 */
def getValueJson(instancia, attribute) throws ScriptException;
```

<b>Description</b>	Method to extract the json on an ontology instance. Useful when we want to extract a subdocument
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>instancia</b>: name of the ontology on which we will query</li> <li>String <b>attribute</b>: attribute which we will recover the value.</li> </ul>
<b>Results</b>	String: value of the attribute in JSON
<b>Use example</b>	On the ontology TestSensorTemperatura:  <pre>def apiutils = new APIUtils(); String attribute2 = "Sensor.geometry"; def resultadoJSON = apiutils.getValueJson(ontology, attribute2);</pre>

### 11.3 getValueJsonArray(instancia, atribute)

<pre> /**  * get the array of values of an attribute from an ontology  * @param ontologyName String  * @param atribute String  * @return value of the attribute as array List&lt;String&gt;  */ def getValueJsonArray(instancia, atribute) throws ScriptException; </pre>	
<b>Description</b>	Method to extract an array of values of the attribute of an ontology.
<b>Parameters</b>	<ul style="list-style-type: none"> <li>String <b>ontologyName</b>: Ontology instance on which we will query</li> <li>String <b>atribute</b>: attribute which we will recover the value.</li> </ul>
<b>Results</b>	List<String>: values of the array
<b>Use example</b>	<p>On the ontology TestSensorTemperatura:</p> <pre> def apiutils = new APIUtils(); String atribute3 = "Sensor.geometry.coordinates"; def resultadoArray = apiutils.getValueJsonArray(ontology, atribute3); </pre>

## 12 APISofia

This API unifies the other APIs. We recommend using the appropriate API.
